

CYBER-DIPLO

Diplomacy is an area for negotiation which has not been capitalized upon between states, prominently between China and the United States of America. Cybersecurity, while receiving much attention from budgetary committees in America, resulting in new intelligence agencies to spring up in defense of all things internet, continue to be outumbered by the forces of bad or ambiguous intent around the world. As computing and networking is a field that had its nascency and early development almost exclusively in the states, agencies minding over the firewalls and access panels continue to be slowed by the comprehensive umbrella of the sector. Unfortunately, international agreements have yet been to review how many common purposes are served by the field of computing and networking here at home in America. The possibility of generating nonengagement between state directed entities in cyber affairs is still resting on the force of diplomacy. Non-engagement between states would drastically reduce the number of incidence, including in banking.

CONTENT UP

Overabundant information is how many describe the current phenomenon of information available at your device. From Silicon Valley we have heard of the demand for content generation but less about the demand for content curation. In the coming decades, while AI continues to dominant for attention, the subject of content and its treatment will likely draw open many fields of expertise, such as traditionally, taxonomy and schema, and progressively, zone and sector development. Regarding the latter, the idea of geopolitical conditions for the admittance of information made locally and assumed locally means that different fields of study and research will coincide in the determination of variously graded information from information mining and content customization.

UNCLE SAM’S LOCAL BREW

The trickle-down effect has at times been dismissed as a rule for the economics and social conditions to improve by stimulus from the top. However, current views include the debate on Uncle Sam’s Studio as a proposition stating that local zones in their geopolitical ties can in fact generate content relevant in such areas as morale in patriotism and in crucial information about new policy additions as well as community to state uplifting as agenda. The idea to push forward guidelines augmented with series of recommendations and novel supply and resource networks across America is central, front, and center to the Uncle Sam’s Studio. The flag of the United States of America flies high, and the thought of nation and state by citizenship likely would promote and advance many types of content which through the media backbone can propagate, as through viral memes, reference manuals, directories, small to mid size commerce networks, and more. The notion that the state can slip forward common agenda does not defeat the notion of minimal government. Instead, it supplements the premise that the state at the government can facilitate and enable, can source and network, and so on. To input significant content that reveals the backbone of future options, designed to be at scale implemented, means that the government will put forward hubs and scaffolding, like in agency, bureau, network, and warehouses, for citizens who are tech savvy to arrange for the “trickle down” or “trickle horizontally” of intelligence that has in large part logic in verbal terms and resources in material forms. The availing of resources to meet many common needs found around all over the nation, can in fact reach the clientele by clever network sourcing, but also through mass deal bargaining, where supply costs would meet meaningful discounts, which will materialize as substantial upgrades in many parts of America.

ZEPPELIN GRADE ODD MED

America is the home of flight in the form of airplanes. Practices of levitation and flying with no vehicle other than one’s body can be found in China and India, but also in the United States. Nevertheless, airplane travel has its heritage largely based in America. Early visions of air travel as a luxury service is fully demonstrated by the architectural interior, for instance, see the zeppelin’s model interior, with table cloth and silverware. As the industry of airplane production meet with challenges and obstacles given the pandemic and mass motions, American airlines may be well advised to see whether luxury class travel may be an area of development. Air tourism may yet be reinstated for American travellers who are by nature intrigued by flight.

The disappearance of tobacco on television and in movies may yet see a pushback from American traditional business in the tobacco industry. A clinician in Calgary is proposing to put forward a new disorder called “tobaqi”, which refers to the delimitation and decrease of interest in work and in social interaction due to the non-use of tobacco given peer pressure, information alerts on cigarette packages, etc. The clinician notes that even a small amount made available to the patient, as little as one cigarette a week, but better each day, could stimulate the patient to proactivity, in work, in conversation, in engagement with colleagues, friends, and family.

SPACE NUT

The point of inhabiting outer space has always been of utmost debate since the success of the Apollo program. New to the scene are those working in Artemis who are also at the same time more ambitious in fathoming what geometry may occupy space terrain as the moon. Recent decades have seen many proposals, including from Fosters and Partners. But behind the scene the offering of one architect who was previously credited with the advancement that Artemis must come online as the aging Apollo astronauts retire - her proposition is that a new hab-lab be “put” ie. reverse propulsion rockets enabled to be landed, on the lunar terrain. However, criticism was founded due to the landing mechanisms’ geometry being a hexagon. People around the world wonder whether “hex-” here meaning six sided polygon, would be mistakenly associated with the notion of cussing, in other words, “to hex”. Defenders of this geometry includes videogame fans of “Halo”, and also tattoo enthusiasts who find this apt.

INTEL.cities

It is arguable that today Calgary faces a crisis from the masterplan and from the vantage of the intacthood of major architecture. Newspaper locally and television networks from the local region simply do not yet have at hand the intelligence to report on the transformation and diminishment of very large architecture. The obstacle of course is that such large rearrangements while seeking a schedule of restoration can be very finicky, depending on what public opinion holds and how it sways. Here in the Exciting Times, we would like to report a major finding discovered early as June in 2023: more than eleven cities in North America have registered large scale seemingly magical transformation affecting very large architecture. Future options should be sought.

HERITAGE 101

The state of architecture as the stage of urban masterplanning both subscribes to the stage of population economics development. These recent three decades saw a spurt of growth which met with meddling in the recent five years as with the even more recent residential developments in downtown. Due to adjustments in populace’s self perception reflecting the condition of the city, often discovered amiss is how upset the perceived value of the city is in juxtaposition with the actual socioeconomic conditions. According to one United Nations’ assessment, Calgary continues to fluctuate between the standard of the first world and the standard for the second world. One of the most glaring error is continuing disregard and disinterest in the life quality of experts invited to the city who carry out tasks related to assessment and adjustment, involving further design and implementation. The city ought to consider raising a survey for all those of profound knowledge invited here inquiring to their quality of life.

BIG MONEY

News releases of politicians raising funds for various in large capital may come under scrutiny in the coming years. The origin of large capital typically have complex accounting and legal framework set up as part of the constitution of the capital. It has been noted that recent two decades have seen sudden funding coming available to the province and the city; however, little is said about the origin of the funds. For example, the Architecture Office is now faced with confrontation with companies of international architecture which claims though still informally that its workers who have raised skyscrapers to current completion stage simply have not been paid. On an aside, wage continues to go up for workers who are lesser to those workers of skyscrapers. The account is about to return to the company in NYC for review.

SAVE.EARTH>

In 2023, there was a convening to hold discussion between advanced members of the military intelligence regarding the current flutter of alarm concerning atomic weapons. The outcome of the convention was a program called “SAVE.EARTH” under the command called peace. The year then and following saw a burgeoning of interest across Asia and other continents in the having of such power as nuclear power while those in the know watch on in horror as the interest escalated to the press conferences given by state actors across the world. Here the note is given that the holding and also the mysterious “defusing” of major units of great destructive power continues to operate under classified status. With the protective status for work in this area, a public relations authority may yet be helpful in upholding the various faculties required for safekeeping and defusin. It is known that the United States and Russia may negotiate towards such ends.

LAW & ORDER

Since earlier in the century many now focus on legal frameworks and policies in agreements to find law and order to offenses large and small, and for the safe and good regulating of larger company and populaces’ requirements for order. For Calgary, for instance, the document “The Protected Zone” lays out basic reasons and continuing disposition as relevant to ownership and management of the larger urban forms as well as older forms in architecture. Despite such great optimism initially in finding agreement to pen, the adoption of such documents’ ideas and premises continue to be a rough point where many doubt the legality as having had been raised by a de facto manner. Think tanks should now sooner rather than later examine the issue of application.
